RRS Race Bred Power Steering Pump Kit

The **RRS** Race Bred Power Steering Pump Kit is a new replacement unit. The pump kit comes with all the attaching hardware to allow a direct bolt up to the original P/S bracket. Un-like the original factory pumps, the race bred pump is fitted with bearings rather than bushes for sustained high speed operation and reliability. The **RRS** pump will remove the small air bubbles that cause your system to groan and moan and can cause hard spots in the steering. The result of this process is a quieter and smoother operation. The **RRS** pump kit has been engineered for today's most demanding performance applications like road racing and autocross competitions but is equally at home on a street performance Ford. The remote mounted reservoir gives you a little more room to work around the engine as well as additional options for placement of the Ford OE style fluid box.

Includes:

- Remote reservoir
- **RRS** race bred pump with pulley
- Conversion brackets
- Bolts & washers

NB. This is a replacement pump only. If the vehicle is originally manual steer you will need to supply & install a double crankshaft pulley system to install .The **RRS** race-bred pump kit is made to replace an original factory pump and is supplied with an adaptor bracket to mount the pump to the original power steering mounting brackets that are **supplied by client.**
